Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

REMARK GenBank staff at the National Library of Medicine created this entry [NCBI gisbseq 138131] from the original journal article.

COMMENT This sequence comes from Fig. 5.

FEATURES Strong homology to human hepatitis B virus.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Vector for increased expression of intronless genes - comprises
intronless gene with at least one near consensus splice sequence, a
promoter and at least one viral cis-acting post-transcriptional
regulatory element
Claim 3; Page 21; 59pp; English.
The present sequence represents a post-translational regulatory element
(PRE) of the Hepatitis B virus. This sequence encompasses enhancer II,
and is within the transcribed portion of the surface antigen gene. This
PRE sequence has been shown to function in cis to increase the
steady-state levels of surface gene transcripts by facilitating
cytoplasmic accumulation of these transcripts. The present PRE sequence
was used to create a novel vector, comprising an intronless gene
containing or more near consensus splice sequences operably linked to a
promoter sequence so that the gene is transcribed in a cell. One or more
copies of a viral cis-acting PRE are also cloned into the vector, and are
transcribed along with the gene, causing export of the gene transcript
from the nucleus into the cytoplasm of the cell. The vector can be used
to increase the expression of an intronless gene containing at least one
near consensus splice sites, preferably cDNA encoding a blood coagulation
factor, particularly factor VIII or IX. The complex allows the targeted
delivery of the vector to a specific cell, e.g. hepatocytes when the
ligand is an asialoglycoprotein which binds the asialoglycoprotein
receptor present on their surface.

Hepatitis B virus antisense vector - directed against cis-acting
post-transcriptional regulatory element
Claim 1; Columns 13-14; 12pp; English.
This sequence represents a hepatitis B virus cis-acting post-
transcriptional regulatory element (PRE). The invention provides a vector
encoding one or more antisense transcripts that are complementary to all
or part of a HBV PRE where the PRE directs export of viral transcripts
from the nucleus to the cytoplasm of a cell. A molecular complex
comprising the above vector can be releasably linked to a conjugate of
a nucleic acid binding agent and a ligand that binds to a component on
the surface of a cell. The vector can be delivered to cells in vitro or
in vivo to inhibit production of viruses having PRE sequences.

XX New bicistronic hepatitis B virus (HBV) X15-c-myc transgene, useful for
XX producing transgenic mouse model systems for human hepatocellular
XX carcinoma, comprises HBV X15 transgene and c-myc transgene -
XX
XX Claim 3; Fig 3; 12pp; English.
XX This polynucleotide represents the sequence of the regulatory and coding
XX regions of the X15 component in the X-myc construct. The invention
XX relates to a bicistronic hepatitis B virus (HBV) X15-c-myc transgene,
XX comprising of the HBV X15 gene and c-myc gene. The myc gene is known to
XX be an activatable oncogene. The transgene encodes a truncated HBV X15
XX protein, respectively. A transgenic mouse containing the transgene
XX construct is useful for screening a candidate substance (CS), to
XX determine whether CS promotes hepatocellular carcinoma. This is
XX determined by exposing a transgenic mouse to CS, and monitoring the mouse
XX for the development of hepatocellular carcinoma, where an increase in the
XX development of hepatocellular carcinoma in the transgenic mouse exposed
XX to CS compared to the development of hepatocellular carcinoma in a
XX transgenic mouse not exposed to CS, indicates that CS promotes
XX hepatocellular carcinoma. The transgenic mice can be employed as a source
XX for cell and tissue culture. The transgenic animal models comprising of
XX the HBV X15-c-myc transgene for hepatocellular carcinoma are superior to
XX any transgenic animal model system for hepatocellular carcinoma in that
XX the transgenic mice develop more aggressive and accelerated onset of
XX malignant liver tumours in all lobes causing death of the affected
XX animals in 20-22 weeks, that is faster than the time taken by the other
XX transgenic animals to even develop a tumour.

XX Recombinant hepatitis B virus genome containing heterologous gene
XX sequences useful for treating liver infections -
XX
XX Disclosure; Columns 35-39; 53pp; English.
XX
XX The invention relates to a recombinant hepatitis B virus genome (HBV)
XX that comprises heterologous gene sequences which express at least one
XX functional heterologous gene product. A host cell transfected with a
XX recombinant HBV genome comprising pol gene sequences, X gene sequences
XX and surface antigen gene (preS1/preS2/S gene) sequences and heterologous
XX gene sequences can be used to express at least one functional
XX heterologous gene product. The invention also provides a method for
XX encapsulating a recombinant HBV genome. The recombinant HBV genomes are
XX useful for the expression of functional heterologous gene products in
XX liver cells. The vectors can be used for anti-viral, anti-tumor and/or
XX gene therapy and particularly for the correction of inherited single-gene
XX defects. Human genetic disorders which can be treated by expression of
XX missing or mutant genes in the liver are familial hypercholesterolemia
XX and ornithine transcarbamylase deficiency. Primary tumors of the liver
XX may benefit from the expression of anti-neoplastic genes in the liver.
XX Existing retroviral vectors and other animal viruses which are used to
XX deliver foreign genes are not liver-specific with regard to their
XX infection or expression unlike hepatitis B viral vectors. Human hepatitis
XX B virus can be delivered through the circulation so there is no
XX requirement for tissue culture for ex vivo liver-directed gene therapy.
XX The present sequence represents the DNA sequence of the genome of HBV
XX adv 2 which comprises the pol gene sequences, X gene sequences and
XX surface antigen gene (preS1/preS2/S gene) sequences.

XX CC This represents the nucleotide sequence of an one copy antisense plasmid
XX CC pCMVasPRE-RZ. The plasmid contains a hepatitis B virus cis-acting post-
XX CC transcriptional regulatory element (PRE). The invention provides such a
XX CC vector encoding one or more antisense transcripts that are complementary
XX CC to all or part of a HBV PRE where the PRE directs export of viral
XX CC transcripts from the nucleus to the cytoplasm of a cell. A molecular
XX CC complex comprising the above vector can be releasably linked to a
XX CC conjugate of a nucleic acid binding agent and a ligand that binds to a
XX CC component on the surface of a cell. The vector can be delivered to cells
XX CC in vitro or in vivo to inhibit production of viruses having PRE
XX CC sequences.

FT      Vector for increased expression of intronless genes - comprises
PT      intronless gene with at least one near consensus splice sequence, a
PT      promoter and at least one viral cis-acting post-transcriptional
PT      regulatory element
XX      Example 1; Pages 21-31; 59pp; English.
XX      The present sequence represents human B-domain deleted factor VIII
CC      cDNA, and a post-translational regulatory element (PRE) of the
CC      Hepatitis B virus, which is present 3' of the STOP codon for factor VIII.
CC      PRE sequences have been shown to function in cis to increase the
CC      steady-state levels of surface gene transcripts by facilitating
CC      cytoplasmic accumulation of these transcripts. The present sequence
CC      is part of a novel vector, comprising an intronless gene containing
CC      1 or more near consensus splice sequences operably linked to a
CC      promoter sequence so that the gene is transcribed in a cell.
CC      Intronless gene transcripts which contain near consensus splice site
CC      sequences are believed to get tied up in the nucleus of the cell where
CC      splicing occurs, rather than being transported to the cytoplasm where
CC      they can be translated into proteins. The PRE sequences are transcribed
CC      along with the gene, causing export of the gene transcript from the
CC      nucleus into the cytoplasm of the cell. The vector can be used
CC      to increase the expression of an intronless gene containing at least one
CC      near consensus splice sites, preferably cDNA encoding a blood coagulation
CC      factor, particularly Factor VIII or IX. The complex allows the targeted
CC      delivery of the vector to a specific cell, e.g. hepatocytes when the
CC      ligand is an asialoglycoprotein which binds the asialoglycoprotein
CC      receptor present on their surface.

XX      Recombinant hepatitis B virus genome containing heterologous gene
XX      sequences useful for treating liver infections -
XX      Example 1; Columns 53-62; 53pp; English.
XX      The invention relates to a recombinant hepatitis B virus genome (HBV)
CC      that comprises heterologous gene sequences which express at least one
CC      functional heterologous gene product. A host cell transfected with a
CC      recombinant HBV genome comprising pol gene sequences, X gene sequences
CC      and surface antigen gene (preS/preS2/S gene) sequences and heterologous
CC      gene sequences can be used to express at least one functional
CC      heterologous gene product. The invention also provides a method for
CC      encapsidating a recombinant HBV genome. The recombinant HBV genomes are
CC      useful for the expression of functional heterologous gene products in
CC      liver cells. The vectors can be used for anti-viral, anti-tumor and/or
CC      gene therapy and particularly for the correction of inherited single-gene
CC      defects. Human genetic disorders which can be treated by expression of
CC      missing or mutant genes in the liver are familial hypercholesterolemia
CC      and ornithine transcarbamylase deficiency. Primary tumors of the liver
CC      may benefit from the expression of anti-neoplastic genes in the liver.
CC      Existing retroviral vectors and other animal viruses which are used to
CC      deliver foreign genes are not liver-specific with regard to their
CC      infection or expression unlike hepatitis B viral vectors. Human hepatitis
CC      B virus can be delivered through the circulation so there is no
CC      requirement for tissue culture for ex vivo liver-directed gene therapy.
